## **Employee Management System**

(Group 1)

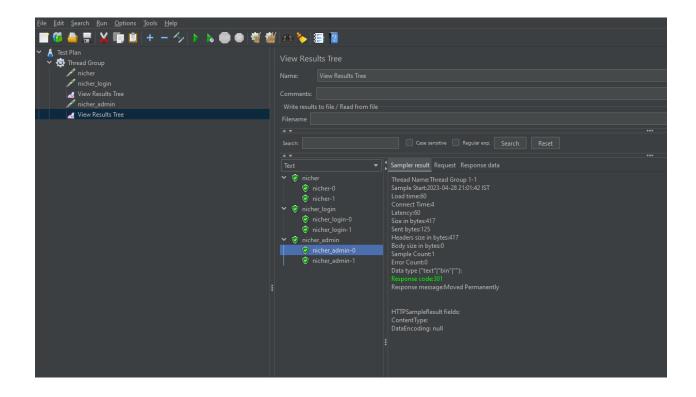

## Load Test or Performance Test Report

Performed performance or load tests on the web version of our app, which is deployed live.

Link: <a href="https://nicher-c9290.web.app">https://nicher-c9290.web.app</a>

The test was conducted using the **Jmeter tool**, which is used to analyze the load-taking ability of our code.

This tool clones the action once performed by simulating 100s of users doing the same task simultaneously to understand the server's capacity.

## We performed testing in 3 rounds.

1st round was conducted by setting the number of users to 10 and setting them simultaneously to log in and use the app using the Jmeter automation.

2nd round had the number of users set to 100, followed by 3rd round, where the number of users was set to 1000.

The app performed perfectly normal for 1st and 2nd rounds signifying at least 100 users could be served simultaneously using any functionality at any time.

The app performed a bit jittery for the 3rd round, where the number of users was set to 1000, and the loop value of repetition was set to 100. This signified the slowness due to server's free tier and bandwidth limitations.

Still, the app could perform the tasks thoroughly without any instance killing. This signifies the robustness of the app and its ability to serve thousands of multiple users simultaneously.

PFA the screenshots of the testing of our app **nicher**.
