Employee Management System
(Group 1)

Report of GUI testing

For performing the GUI Test, I used the **Selenium** tool.
The link we tested is: https://nicher-c9290.web.app/

In GUI testing, the user uses the website while the selenium tool records the movements and button presses of the user. When all the functionalities of the website are tested, we click play. Then the selenium tool clones our actions and does the same tasks we did and checks if there are any discrepancies in the website's UI. If the tool reaches where the user reached at the end, all the cases are checked off and the website is good to go in terms of UI.

Attached below is the screenshot of the selenium tool that checked off all the 63 tasks I performed while testing our website.
